

Abducadir Aligure

Supply chains, data and practical tools.

I'm a Purchasing and Logistics Engineering student nearing graduation at JAMK, based in Helsinki. I'm interested in how supply-chain processes and systems connect, and what better data helps people decide.

Alongside my studies, I build software with AI and test ideas against problems I've seen in real work. I'm looking for a junior role in analytics, supply-chain technology or implementation.

PEOPLE

Listen, explain and follow through.

OPERATIONS

Learn how everyday tasks fit together.

BUILDING

Try an idea, check it and improve it.

Helsinki, Finland | Finnish · English · Somali

START HERE

Selected work

Four examples of working from a real problem to data, software and a clearer next step.

PROJECT	FOCUS	STAGE
SafkaStock	Supply-chain data and integrations	Side project / in development
AQOON service tools	Customer workflows and operations	Used in service delivery
Finnish letter assistant	AI and language	Side project / working MVP
Groundwater nitrate analysis	Data analysis / HAN coursework	University project / 2025

Other work

Two additional examples of working through data and application behaviour.

How I work

I use Codex and Claude Code daily to help me build and work through code. Each project gave me a chance to try something, check how it worked and decide what to improve next.

SUPPLY-CHAIN DATA AND INTEGRATIONS

SafkaStock

A restaurant's unanswered margin questions led me to build, test and rethink a supply-chain tool.

Side project / in development | Customer discovery, workflow design and AI-assisted development

The problem behind it

A pizzeria owner had supplier records and a till system, but still could not easily work out what a pizza cost to make or whether to raise prices. I wanted to connect that information so it could support everyday decisions.

What the first pilot exposed

A friend and I built and tested an early version. We tried to cover too much: purchases, stock, sales and waste. Missing product data and manual setup made onboarding too demanding for small businesses. Adding more features did not fix the foundation.

What I changed

I shifted the starting point towards businesses that already have supplier records and sales data. I am building around supported Kespro PDFs and spreadsheets, turning them into structured records and mapping products and units before comparing costs. Accepted mappings can be reused, and calculations stay traceable to their source.

My work and the current scope

I use Claude and Codex to develop document imports, database workflows and purchasing comparisons, managing changes through GitHub and checking them with reviews and tests. Connecting recipes and sales is the next step towards dish margins; inventory and waste handling remain later work.

What I learned

A price comparison is only useful if the products and units really match. Working through messy records has made me more careful about data quality, integrations and what a calculation actually proves. It also changed how I plan the build: solve the foundation first, then add the next useful connection.

Built with: TypeScript / PostgreSQL and Prisma / PDF and spreadsheet imports / Claude, Codex and GitHub

The first version was co-built with a friend. I am continuing the work as a side project. Source code and customer files are private.

CUSTOMER WORKFLOWS AND OPERATIONS

AQOON service tools

Customer conversations shaped the website, intake and follow-up tools I built.

Used in service delivery | Service discovery, pilot delivery and AI-assisted development

The gap I saw

Families could benefit from a service without knowing it existed or how to apply. Through AQOON, I spoke with Somali-speaking families and service providers to understand where the process broke down.

What I did

I ran summer service-development pilots with Pilke Päiväkodit and the City of Vantaa. My work included explaining services, helping with applications, coordinating with providers and following up. Those conversations also showed me what our tools needed to record.

What I built

Using Claude Code, I built the website, enquiry forms and a private tracker for requests, conversation notes and next actions. I worked on the flow from a short initial enquiry to a more detailed conversation, so people did not have to complete a long questionnaire before getting help.

A distinction that mattered

A contact, an application and a confirmed service start are different outcomes. Keeping them separate helped me report what had actually happened and see where follow-up was still needed. This work taught me to connect software decisions with the people using the process.

Built with: HTML, CSS and JavaScript / Supabase / Vercel

Public website and code walkthrough available. Family records and the operator tracker remain private.

AI AND LANGUAGE

Finnish letter assistant

Helping someone understand a letter, beyond translating its words.

Side project / working MVP | Problem research, application design and AI-assisted development

The problem

Growing up, I helped my family understand Finnish official letters. Even after translating the words, there could still be questions: what does this mean for me, do I need to reply, and is there a date I need to remember? I wanted to explore whether AI could make those letters easier to understand in plain Somali.

What I built

I built an application that explains a letter and supports follow-up questions and reply drafts. Using Claude Code, I developed the screens and the steps around the AI: a rule-based classifier sorts messages into seven types, the app chooses a model, and checks run on the response before it is shown.

A problem inside the problem

An explanation becomes less useful if it adds a date or commitment that was never in the letter. I worked on checks for invented dates, mismatched weekdays and unsupported promises in reply drafts. This taught me to think about the kind of message being handled and the information the user has actually provided.

Where I got to

The core MVP is implemented, including the classifier, model routing and tests for the response checks. My next step would be to try a wider range of letters with Somali-speaking readers and find out which explanations help them understand what to do next.

Built with: Next.js and React / Express and Supabase / LLM APIs and model routing

Separate from the public AQOON website. Private source; wider reader evaluation is still needed.

DATA ANALYSIS / HAN COURSEWORK

Groundwater nitrate analysis

An exchange-year project connecting data preparation, modelling and an environmental question.

University project / 2025 | Data preparation and model comparison as part of university coursework

The question

During my exchange at HAN in the Netherlands, I worked on groundwater nitrate prediction in the context of the Dutch dairy sector. The project gave me a practical way to use data analysis beyond spreadsheet reporting.

What I worked on

I cleaned environmental datasets in Python and compared Random Forest and XGBoost models. The work connected preparing usable data with testing different approaches to the prediction task.

What I took from it

I gained a foundation in Python data analysis and model comparison that I now build on in my own projects. My Python and SQL skills are still developing; I use AI support for coding and keep working on my ability to understand and check the result.

Built with: Python and Pandas / scikit-learn / Random Forest and XGBoost

Academic work completed during my Data-Driven Decision Making studies at HAN. This was not a deployed prediction service.

OTHER WORK

Further examples

Smaller ideas I have explored along the way.

RideLink: shared-ride coordination

I built a team dashboard, calendar imports and a shared page for parents to offer or claim seats. A database transaction checks remaining capacity before saving a booking. This taught me to handle simultaneous requests, not just the first successful click. Calendar updates and cancellations still need work before a full team trial.

Side project / working MVP

Road-accident data mining

Coursework comparing classification models on UK road-accident severity data. I explored class imbalance and how different models handled the rarer, more serious cases. One useful lesson was that a high overall accuracy can still hide poor predictions for the cases that matter most.

Coursework

ABOUT / EXPERIENCE

Logistics student. Hands-on learner.

I'm finishing my Purchasing and Logistics Engineering degree at JAMK. Work in retail, food operations and warehouses has made me curious about what happens behind the numbers: how goods move, where information gets lost and what people need to make a decision.

How I work

I start by asking someone how the work actually happens. Then I map the problem, build a small next step and check it. I use Claude Code and Codex daily for planning, coding, review and tests. SafkaStock has given me practice with imports, databases and integrations, including plenty of cases where the first approach needed rethinking.

AQOON / Service-development pilots

Summer 2026 / Customer work and workflow tools. Ran projects with Pilke Päiväkodit and the City of Vantaa. Spoke with families, supported applications, coordinated follow-up and built tools to organise the work.

Witas Agile Experiments Incubator

October to November 2025 / 135-hour internship. Worked on the first SafkaStock MVP and customer testing during a 135-hour internship.

Customer service and operations

Retail, food operations and warehouse roles. At R-kioski, I handled independent shifts, customer enquiries and stock rotation. At IKEA, I worked with stock replenishment and food-hygiene procedures. During my exchange in the Netherlands, I also worked in automated fulfilment.

What I'm studying

Purchasing and Logistics Engineering at JAMK, nearing graduation. During my 2024–2025 exchange at HAN in Arnhem, I studied Data-Driven Decision Making in Business and used Python for data preparation and modelling.

What I'm looking for

I'm looking for a full-time junior role in analytics, supply-chain technology or implementation. I want to work with real operational data, understand customers' problems and learn from an experienced team. I'm based in Helsinki and open to hybrid or remote work.
